Course Description

Python is a very popular open-source programming language for machine learning. Its interactive programming environment and powerful data analysis capabilities make Python an ideal tool for machine learning.

This workshop will provide you with an introduction to machine learning using the Python programming language. We'll cover supervised and unsupervised learning in the form of classification, regression, and clustering. Finally, we'll learn how to apply machine learning in practice.

Prerequisites

Please bring your own Windows laptop and complete Lab 0 to install all of the necessary software before the workshop begins.

Module Descriptions

1. **Introduction** – introduce machine learning and the Python programming language
2. **Classification** – learn how to predict categorical outcomes
3. **Regression** – learn how to predict numeric outcomes
4. **Clustering** – learn how to predict groups of data based on similarity
5. **ML in Practice** – learn how to prep, tune, and evaluate machine learning models
6. **Conclusion** – learn where to go next for additional training and resources

Learning Objectives

When students are finished with this workshop, they should understand the following:

Introduction

- What machine learning is, why it is important, and how the machine learning process works
- What Python is and why it has become so popular for machine learning
- How to create data types, data structures, subset data tables, and find help on Python topics

Classification

- What classification is, how it works, and applications for classification
- What are k-nearest neighbors, decision trees, and neural networks
- How to train, test, and make predictions with a classifier

Regression

- What regression is, how it works, and applications for regression
- What are linear regression, multiple regression, and neural network regression
- How to train, test, and make predictions with regression

Clustering

- What clustering is, how it works, and applications for clustering
- What are k-Means and hierarchical clustering
- How to group similar data points using clustering algorithms

ML in Practice

- What the machine learning process is
- What are overfitting and the curse of dimensionality
- How to prep data, tune hyperparameters, and evaluate models, and deploy models

Course Outline

Introduction

Lecture

- What is machine learning?
- What is Python?

Lab

- Installation and setup
- Hello World
- Working with data types
- Working with data structures
- Working with data frames

Classification

Lecture

- Classification
- K-nearest neighbors
- Decision tree classifier
- Neural network classifier

Lab

- Predicting categories with k-nearest neighbors
- Predicting categories with a decision tree
- Predicting categories with a neural network

Regression

Lecture

- Regression
- Simple linear regression
- Multiple linear regression
- Neural network regression

Lab

- Predicting values with simple linear regression
- Predicting values with multiple linear regression
- Predicting values with a neural network

Clustering

Lecture

- Clustering
- k-Means clustering
- Hierarchical clustering

Lab

- Grouping data with k-means clustering
- Grouping data with hierarchical clustering

Machine Learning in Practice

Lecture

- The machine learning process
- Overfitting, underfitting, and regularization
- The curse of dimensionality

Lab

- Data preparation
- Hyperparameter tuning and model selection
- Evaluating models

Conclusion

Lecture

- Where to go next
- Course summary
